

RGP1 Rope Polestrap 16mm

Accredited to: EN 358

Material: 16mm hawser laid nylon rope

Fittings: Plated steel

Weight: 1.5 kgs

Features: Sewn cordura protector

Max Arrest Force: **RESTRAINT ONLY**

The RGP1 is a pole strap/work-positioning device, designed to be clipped to the side dees of a harness or work-positioning belt. The adjuster is easy to use “one handed” either under tension or not. The 16mm hard lay rope is **additionally protected by a cordura sleeve** in the work area, to offer some protection against abrasion and extend the life of the product. The 2m length of the RGP1 allows the user enough freedom of movement, without being exposed to a fall.

The RGP1 can be used for pole climbing, but excels when used for mast climbing and maintenance and general work on open steel structures. Once the structure is climbed, the user can attach the RGP1, adjusting it to the required length. The operative can then use both hands to perform tasks whilst in a safe and comfortable position. This device is normally used in conjunction with an RGH3 or RGH4, which allows for the attachment of additional fall arrest equipment.

(For details of daily inspection procedures, see the info sheet)
